

CPS-2F added auxiliary locations | $\alpha = 0.5$
All tested pairs: 33 hurricane + 12 protein pairs

Curve A (solid) Curve B (hatched)

Each bar: $100 \times \text{added locations} / [2n(n-1)]$, using its own curve size n ; original vertices excluded.

Proteins: existing w=16; hurricanes: no additional subsampling.

Normalized percentages do not compare absolute counts or isolate a domain effect.

* Auxiliary and single-curve construction completed; the subsequent CPS search reached its transition limit.
