

CPS-2F added auxiliary locations | $\alpha = 0.5$

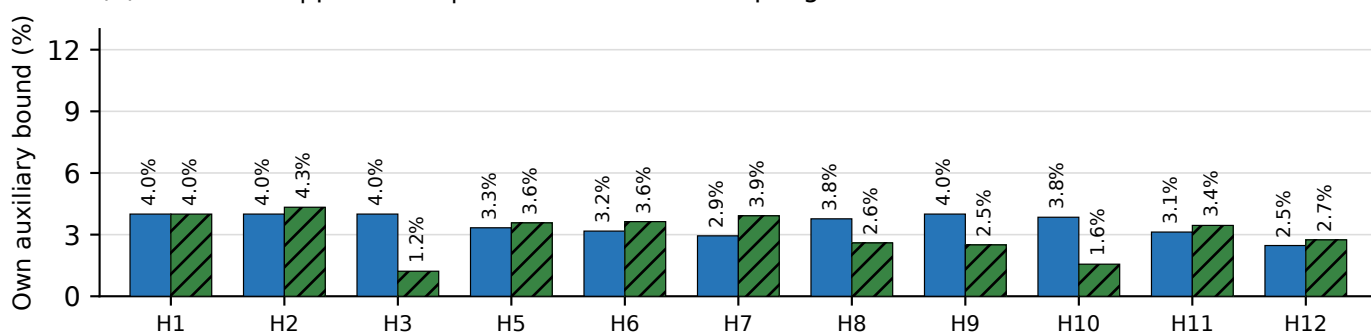

Common comparison set: 31 hurricane + 12 protein pairs

Curve A (solid) Curve B (hatched)

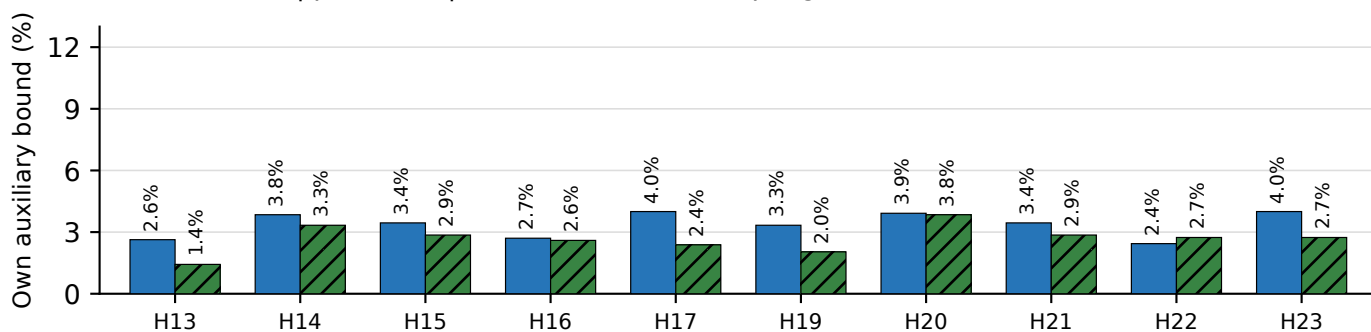

(a) Proteins | existing w=16 subsampling

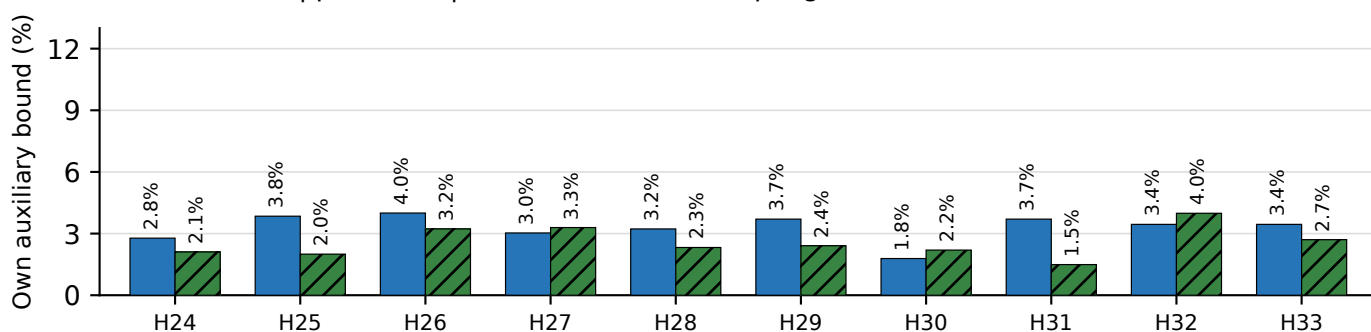

(b) Hurricanes | panel 1/3 | no additional subsampling

(c) Hurricanes | panel 2/3 | no additional subsampling

(d) Hurricanes | panel 3/3 | no additional subsampling

Each bar: $100 \times \text{added locations} / [2n(n-1)]$, using its own curve size n ; original vertices excluded.

Proteins: existing w=16; hurricanes: no additional subsampling.

Normalized percentages do not compare absolute counts or isolate a domain effect.

Common set excludes H4 and H18; stable aliases are mapped in pair_aliases.csv.
