

Compression under continuous and discrete fidelity

Proteins · 12 pairs

Hurricanes · 31 pairs

○ CPS-2F · continuous fidelity

■ CPS-3F · discrete fidelity

Further left = fewer vertices retained

Longer line = greater difference between methods

One row per pair; sorted by percentage-point gap.

Both outputs satisfy their respective constraints.

Retained = $100 \times (kA + kB) / (nA + nB)$

Common comparison set; $\alpha = 0.5$
